in a thermodynamic setting for a single phase usually fluid the thermodynamically defined pressure involving the change in energy with respect to volume is often assumed to be equal to the physically measurable pressure related to the trace of the stress tensor within the framework of hybrid mixture theory and hence the coleman and noll technique of exploiting the entropy inequality we show how the two thermodynamically defined pressures and the pressure relating to the trace of the stress tensor are related and discuss the physical interpretation of each of them in the process we show how one can convert directly between different combinations of independent variables without re exploiting the entropy inequality authors abstract
